

Deployment Report - Manhattan

Deployment

Deployment production memakai Ubuntu 22.04, Nginx reverse proxy, MySQL, systemd service, build Gradle untuk backend, dan build Tailwind/esbuild untuk frontend. Script deploy.sh mengotomasi instalasi dependency, build, konfigurasi Nginx SSL, dan service startup.

Dokumen Pendukung

File pendukung deployment: deploy.sh, deploy/manhattan.conf, deploy/manhattan.service, application-prod.yml.

Screenshot Kode

Documentation Evidence - README

```
73  mysql -u root -p
74  ```
75
76  ```sql
77  CREATE DATABASE manhattan CHARACTER SET utf8mb4;
78  CREATE USER 'manhattan'@'localhost' IDENTIFIED BY 'manhattan';
79  GRANT ALL ON manhattan.* TO 'manhattan'@'localhost';
80  FLUSH PRIVILEGES;
81  ```
82
83  Jalankan schema:
84
85  ```bash
86  mysql -u manhattan -pmanhattan manhattan < server/src/main/resources/schema.sql
87  ```
88
89  ### 2. Jalankan server
90
91  ```bash
92  cd server
93  ./gradlew bootRun
94  ```
95
96  Server berjalan di 'http://localhost:8080'.
97
98  ### 3. Jalankan client
99
100  ```bash
101  cd client
102  npm install
103  npm run dev
104  ```
105
106  Buka 'http://localhost:3000' di browser.
107
108  > Untuk development lokal, buka dua tab browser berbeda. 'IpGuardInterceptor' menambahkan suffix unik ke '127.0.0.1' sehingga dua tab bisa berjalan sebagai dua "user" berbeda.
109
110  ## Konfigurasi
111
112  Konfigurasi server ada di 'server/src/main/resources/application.yml'. Untuk production, gunakan environment variables:
113
114  ```bash
115  cp .env.example .env
116  # Edit .env dengan kredensial database production
117  ```
118
119  | Variable | Default | Keterangan |
120  |---|---|---|
121  | 'DB_URL' | 'jdbc:mysql://localhost:3306/manhattan' | JDBC URL database |
122  | 'DB_USERNAME' | 'manhattan' | Username database |
123  | 'DB_PASSWORD' | 'manhattan' | Password database |
124  | 'SERVER_PORT' | '8080' | Port Spring Boot |
125
126  ## Deploy ke production
127
128  Script 'deploy.sh' menangani seluruh proses deploy ke Ubuntu 22.04 LTS dari nol:
129
130  ```bash
131  chmod +x deploy.sh
132  sudo ./deploy.sh yourdomain.com
133  ```
134
135  Yang dilakukan script:
136  1. Install Java 21, Node.js 20, MySQL, Nginx
137  2. Buat database dan jalankan schema
138  3. Build server JAR via Gradle
139  4. Build client (bundle JS + minify CSS)
```
